

std::runtime_error

```
classDiagram
    InvalidCredentialsError --|> std_runtime_error
    class InvalidCredentialsError {
        +InvalidCredentialsError()
    }
    class std_runtime_error {
    }
```

The diagram illustrates an inheritance relationship. A light gray box at the bottom represents the 'InvalidCredentialsError' class. It contains the class name in the top section and a public constructor '+ InvalidCredentialsError()' in the bottom section. A blue arrow with an open triangular head points from the top of this box to a white box at the top. The white box represents the 'std::runtime_error' class and contains only the class name in its top section. The arrow indicates that 'InvalidCredentialsError' inherits from 'std::runtime_error'.

InvalidCredentialsError

+ InvalidCredentialsError()
